DETAILED ACTION

Allowable Subject Matter

1. Claims 1-19 are allowed.

The following is a statement of reasons for the indication of allowable subject matter:

2. The prior art teaches a cantilever metal spring layer that protrudes from a substrate, where the metal spring has an internal stress gradient, which causes the metal spring to bend away from the substrate. The previous rejections have been stating that it would be inherent that the metal spring structure has an internal stress gradient on the anchoring portion to be the opposite from the portion that extends away from the anchoring portion. The examiner has considered the previous Applicant's arguments and finds them to be persuasive on the basis that it would not be inherent if the adhesion properties in the anchoring region are greater than the internal stress gradient, thus resulting in the metal spring from not peeling away from the substrate anchoring region. The Applicant has also given arguments on how having an internal stress gradient on the anchoring portion to be the opposite from the portion that extends away from the anchoring portion to also be non-obvious; on the basis of these arguments claims 1-19 are found novel.
